

# From scheduling and Phase 2 generation viewpoints

Yu-Ting Wu (EA ARC)  
and Phase 2 Generation Group in EA

# What is Phase 2?

- Once a project has been approved for scheduling, it passes to Phase 2.

- Each approved project will be assigned an ALMA Contact Scientist (CS).
- A project Helpdesk (HD) ticket will be opened on behalf of the PI for communication with the CS and others.
- ALMA staff will generate the Scheduling Blocks and, in case of problems, will contact the CS and the PI. If no problems are found, the project will be submitted to the ALMA observing queue to await execution at the telescope.

# Why we care about scheduling and Phase 2 generation?

---

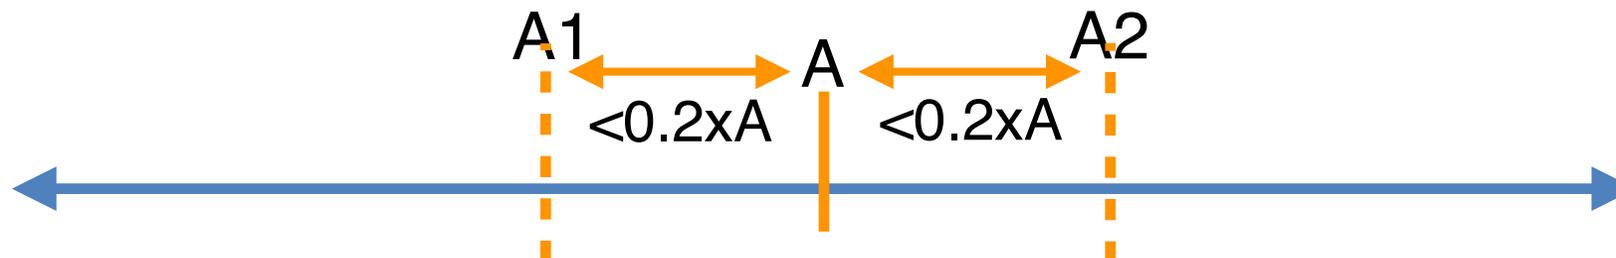

- Various aspects of a proposed observation such as weather conditions or requested angular resolution and Largest Angular Structure (LAS) are important when an observation is scheduled.
- Let's plan observations to maximize project completion to achieve our scientific goals!

# 1. Angular resolution

- Observations are scheduled based on the angular resolution
- For scheduling feasibility and Quality Assurance (QA) purposes, if the PI selects a single value for the Desired Angular Resolution or a range narrower than 20% around its center value, a range of +/-20% around the single or center value specified will be enforced (Section 4.3.2 of the PG).

- ScienceGoal (example)
  - General
  - Field Setup
  - Spectral Setup
  - Calibration Setup
  - Control and Performance
  - Technical Justification

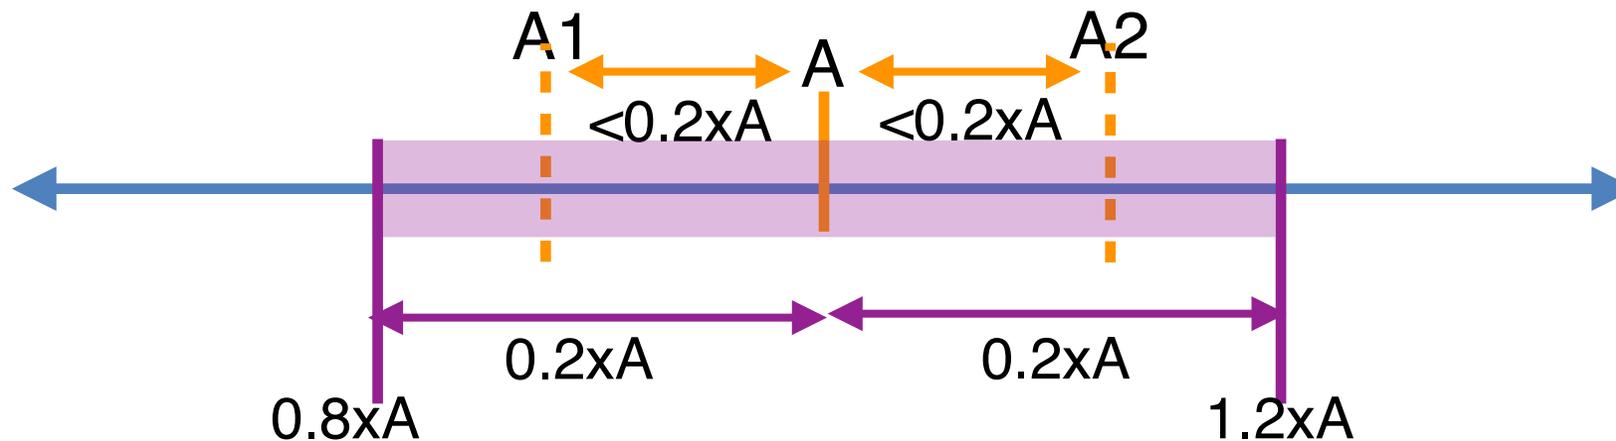

Shortest baseline	0.009 km	0.015 km	0.256 km
Maximum recoverable scale	74.734 arcsec	34.366 arcsec	0.558 arcsec
Desired Performance			
Desired Angular Resolution (Synthesized Beam) <input type="radio"/> Single <input checked="" type="radio"/> Range <input type="radio"/> Any <input type="radio"/> Standalone ACA			
	2.30000	arcsec	to 2.70000 arcsec

# 1. Angular resolution

- Observations are scheduled based on the angular resolution
- For scheduling feasibility and Quality Assurance (QA) purposes, if the PI selects a single value for the Desired Angular Resolution or a range narrower than 20% around its center value, a range of +/-20% around the single or center value specified will be enforced (Section 4.3.2 of the PG).

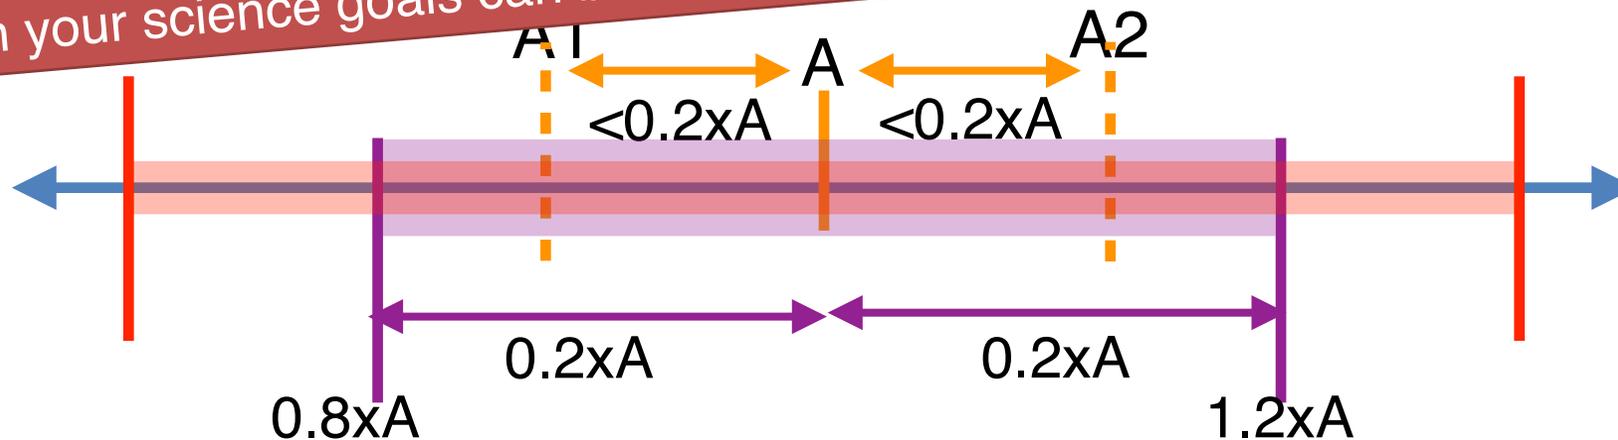

# 1. Angular resolution

- Observations are scheduled based on the angular resolution
- For scheduling feasibility and Quality Assurance (QA) purposes, if the PI selects a single value for the Desired Angular Resolution or a range narrower than 20% around its center value, a range of +/-20% around the single or center value specified will be enforced (Section 4.3.2 of the PG).
- Whenever a range of **angular resolution is acceptable for the science goals**, PIs are encouraged to enter a range of Desired Angular Resolution broader than 20% around its center value.

do this only when your science goals can be achieved!!

# 1. Angular resolution

- Whenever a range of angular resolution is acceptable for the science goals, PIs are encouraged to enter a range covering more than one configuration.

do this only when your science goals can be achieved!!

Configuration information

Antenna Beamsize ( $1.13 * \lambda / D$ )	12m	50.656 arcsec	7m	86.840 arcsec
Number of Antennas	12m	43	7m	10

Desired Performance

Desired Angular Resolution (Synthesized Beam)  Single  Range  Any  Standalone ACA

1.00000 arcsec to 5.00000 arcsec

Largest Angular Structure in source 75.00000 arcsec

Desired sensitivity per pointing 0.50000 mJy equivalent to 1.8507 mK @ 5.00 " and 0.046267 K @ 1.00 "

Bandwidth used for Sensitivity User Frequency Width 10.00000 km/s

Override OT's sensitivity-based time estimate (must be justified)  Yes  No

Science Goal Breakdown: time estimate, clustering, beam and configurations **Planning and Time Estimate**

Simultaneous 12-m and ACA observations  Yes  No

Are the observations time-constrained?  Yes  No

Note: The time in brackets is that required to reach the sensitivity. Operational requirements often mean that the actual observed time is longer, especially for mosaics. Please see the User Manual for more details.

**Input Parameters**

Requested sensitivity	0.5000 mJy
Bandwidth used for sensitivity	10.000 km/s
Representative frequency (sky, first source)	114.950 GHz

**Estimated Total time for Science Goal** 1.30 d

Cluster 1

Source Name	RA	Dec	Velocity
NGC1291	03:17:18.6000	-41:06:29.048	837.100 km/s

**Possible Configuration Combinations**

	12-m (1)	12-m (2)	7-m	TP	Nominal Beam(")	Max expected axial ratio
C-1	None	Yes	Yes	Yes	2.867 x 3.166	1.5
C-2	None	Yes	Yes	Yes	1.948 x 2.152	1.5
C-3	None	Yes	Yes	Yes	1.17 x 1.357	1.5

**Input Parameters**

Precipitable water vapour (all sources) 5.186mm (7th Octile)

**Time required for 12m (1) [C-3]**

Time on source per pointing (first source)	2.82 h [ 2.79 h]
Total number of pointings (all sources)	1
Number of tunings	1
Total time on source	2.82 h [2.79 h]
Total calibration time	1.24 h
Other overheads	15.07 min
Total time for 1 SB execution	1.08 h
Number of SB executions	4

Table 3: Planned 12-m Array Configuration Schedule for Cycle 10. Configuration properties are given in Section A.2.

mentioned in Nagai-san’s talk

# 3. Spectral setup

- Avoid placing spectral windows (spw) close to the baseband edge
- Any spw located within 30 MHz of the baseband edge could result in compromised flux calibration and might cause problems for finding the tuning solution for Local Oscillator signals as well.

Description	Suggestion
Part of spw S1 in BB 1 lies within 30 MHz of the baseband edge. This could	Move the spw away from the baseband edge

mentioned in Jorge's talk

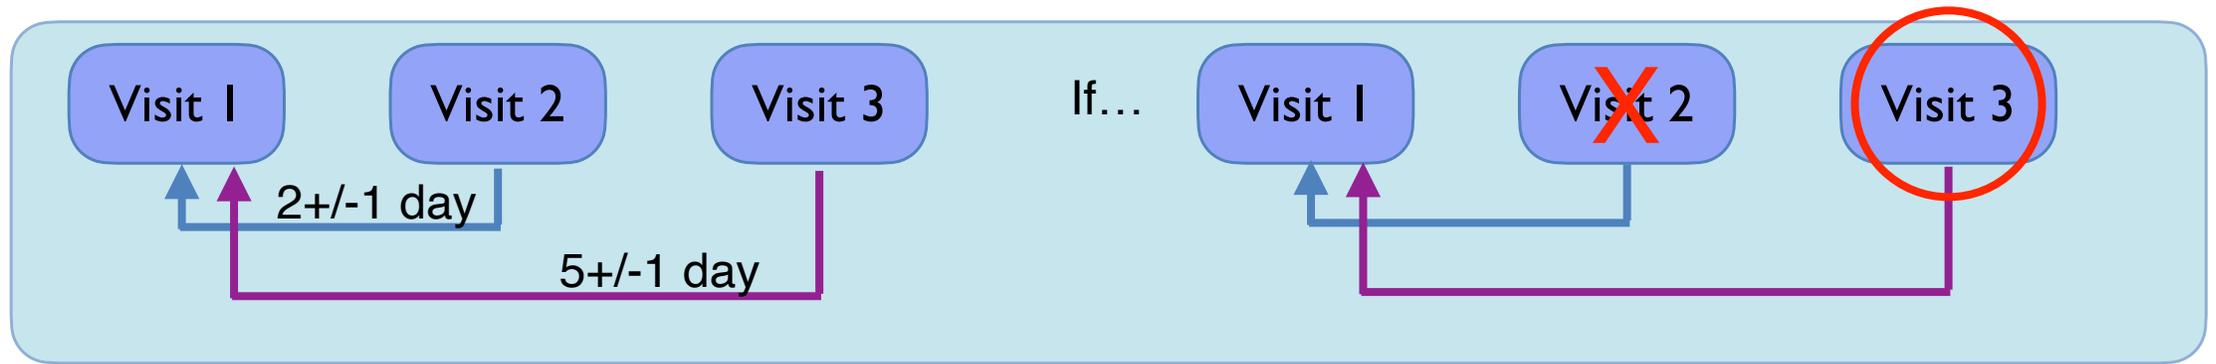

# 4. Multiple-visit observation

- Two possible strategies

# 4. Multiple-visit observation

Please specify the arrangement of visits for your observation.

Visits can either be for a specific date or relative to a previous visit.

The first visit can be defined as having an arbitrary start date/time

Visits specified : 3	
Visit Constraints (UTC)	
Visit 1 :	Arbitrary start
Visit 2 :	To be scheduled 2.0 d after <span style="border: 1px solid red; padding: 2px;">visit 1</span> with a margin of $\pm 1.0$ d
Visit 3 :	To be scheduled 5.0 d after <span style="border: 1px solid red; padding: 2px;">visit 1</span> with a margin of $\pm 1.0$ d

## 5. TP only observation

---

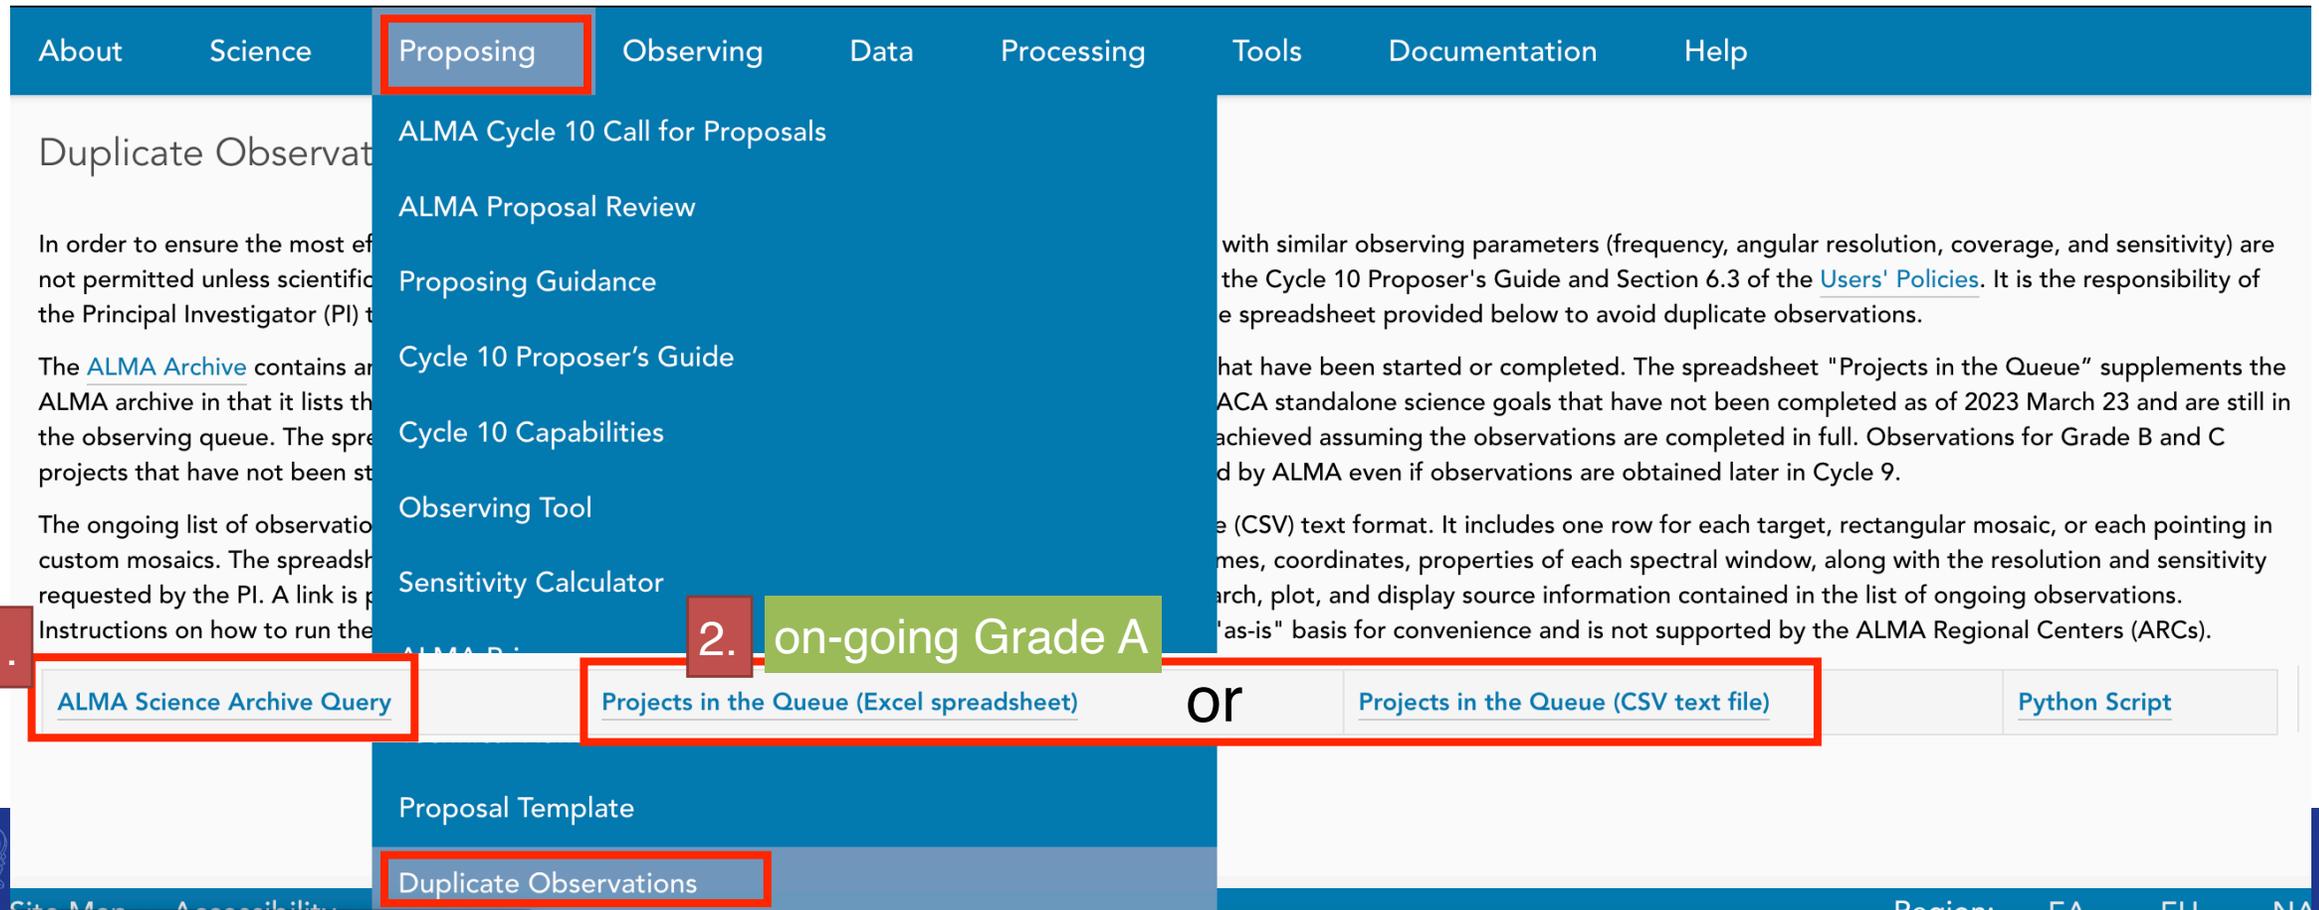

- Section A.3 of the ALMA Cycle 10 Proposer's Guide
  - The TP Array cannot be requested in a standalone mode using the OT. **However**, if a user has **existing 7-m Array data** through their own program or through archival data, but now realizes that TP Array data are needed to obtain short spacings, **they can submit a proposal requesting both the 7-m Array and TP Array.**
  - The proposal **should indicate that only the TP Array is needed** and that the 7-m Array should be descoped if the proposal is accepted. This option is available only if the 7-m Array data have already been obtained.

# 6. Checking for duplications

- Duplicate observations of the similar location on the sky with similar observing parameters (frequency, angular resolution, coverage, and sensitivity) are not permitted unless scientifically justified (Section 4.4.1)

The screenshot shows the ALMA website navigation menu. The 'Proposing' tab is highlighted with a red box. A dropdown menu is open, listing various resources. A red box highlights the 'ALMA Science Archive Query' link, with a red '1.' next to it. A green box highlights the 'on-going Grade A' link, with a red '2.' next to it. A red box highlights the 'Projects in the Queue (Excel spreadsheet)' and 'Projects in the Queue (CSV text file)' links. A red box highlights the 'Duplicate Observations' link at the bottom of the page.

Navigation menu: About, Science, **Proposing**, Observing, Data, Processing, Tools, Documentation, Help

# 6. Checking for duplications

## • Criteria

### ALMA Users' Policies

#### Appendix A Definition of a Duplicate Observation

A proposed observation is considered a duplicate of another observation if *all* of the following conditions are met:

##### Target field location

- For single-field interferometry, the proposed position coincides within the half-power beam width of the other observation. Moving objects (e.g., Solar System objects) will be identified by name.
- For mosaic observations, more than 50% of the proposed pointings are within the half power beam width area covered by the other observation.

##### Angular Resolution

- The proposed angular resolution differs by a factor of  $\leq 2$  from the other observation.

##### Spectral windows

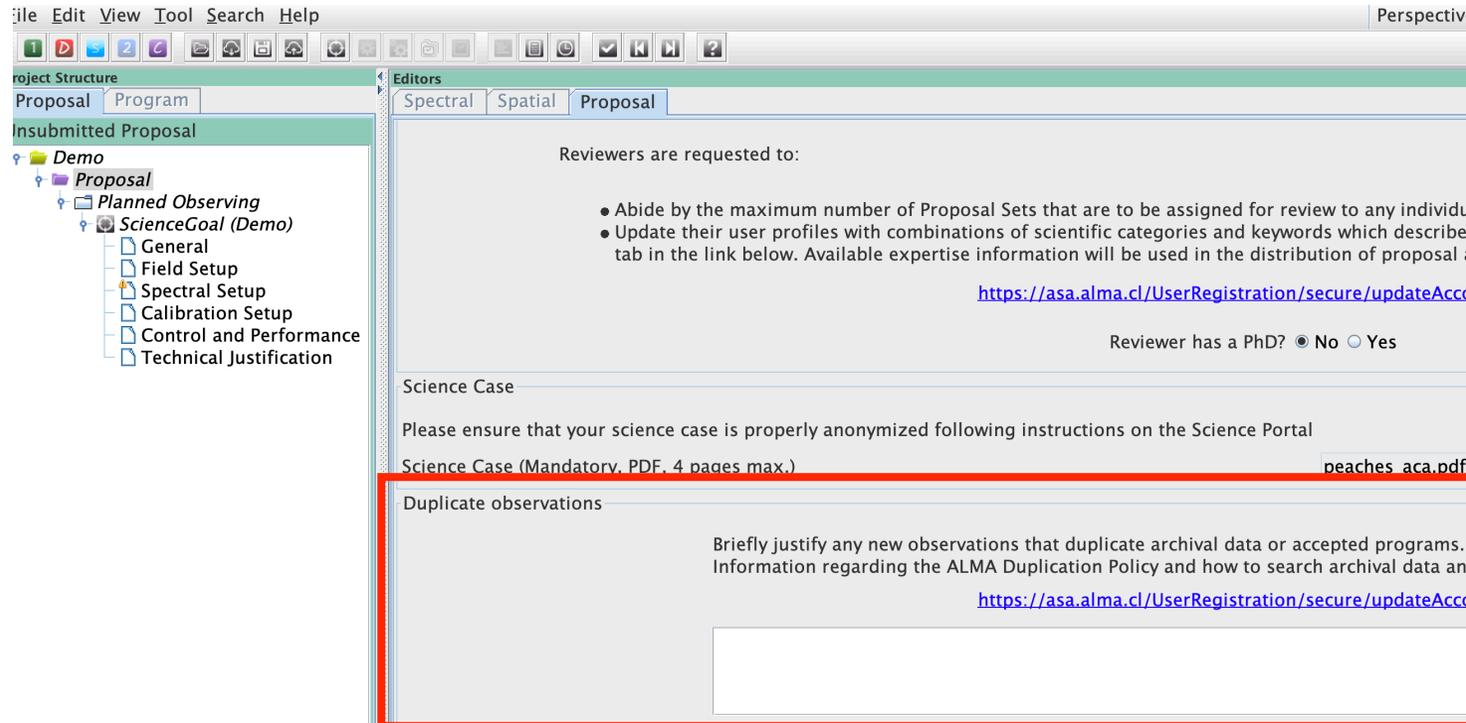

- Continuum: The requested sensitivity (rms) for the aggregate bandwidth is better by a factor of  $\leq 2$  from the other observation and the requested frequency is within a factor of 1.3.

– or –

- Spectral line: If the central frequency in any requested correlator window observed in Frequency Division Mode (FDM) mode is encompassed by the other observation observed in FDM mode and the sensitivity per spectral channel, after smoothing to the same spectral resolution, is better by a factor of  $\leq 2$ .

To be considered a “continuum” observation, the proposed correlator setup must contain 2 or more windows with a bandwidth  $> 1.8$  GHz.

Solar observations will not be checked for duplications.

The screenshot shows the ALMA proposal submission interface. On the left, a tree view shows the proposal structure: **Project Structure** (Proposal, Program), **Insubmitted Proposal** (Demo), and **Proposal** (Planned Observing, ScienceGoal (Demo), General, Field Setup, Spectral Setup, Calibration Setup, Control and Performance, Technical Justification). The main panel shows the **Editors** section with tabs for Spectral, Spatial, and Proposal. The **Proposal** tab is active, displaying a form for reviewers. The form includes a section for **Reviewers are requested to:** with bullet points: "Abide by the maximum number of Proposal Sets that are to be assigned for review to any individual" and "Update their user profiles with combinations of scientific categories and keywords which describe their expertise in the field of astronomy and astrophysics." Below this is a link: <https://asa.alma.cl/UserRegistration/secure/updateAcco> and a radio button for "Reviewer has a PhD?" (No/Yes). The **Science Case** section includes a text area for "Please ensure that your science case is properly anonymized following instructions on the Science Portal" and a file upload field for "Science Case (Mandatory, PDF, 4 pages max.)" with a file named "peaches\_aca.pdf". The **Duplicate observations** section includes a text area for "Briefly justify any new observations that duplicate archival data or accepted programs. Information regarding the ALMA Duplication Policy and how to search archival data can be found at: <https://asa.alma.cl/UserRegistration/secure/updateAcco>".

# 7. Resubmission of an unfinished proposal

---

- Proposal teams that submit a Cycle 10 proposal to observe some or all the SGs of an unfinished project will have the relevant SGs identified as a “resubmission”.
- Criteria: Appendix A of the Users’ Policies
- Policies (Section 4.4.2 of the ALMA Cycle 10 Proposer’s Guide):  
For such resubmissions, the relevant portion of the Cycle 10 proposal will be canceled if the observations are successfully completed in Cycle 9. Observations started in a previous cycle and accepted as a resubmission in Cycle 10 will continue to be observed with **the setup of the previous cycle.**

## 8. Change requests (Section 8 of the ALMA Users' Policies)

---

- Triple-check all setups before the proposal submission deadline!!
- After the PIs have been notified of the results of the proposal review process, PIs of scheduled proposals may request necessary changes to their project via the ALMA Helpdesk.
- Major changes (defined in Appendix B of the ALMA Users' Policies) are allowed **only if the change is essential for the science goals** of the project. Any major change request by a PI must be made by submitting a Helpdesk ticket and will only be implemented after the approval of the change request.

## 8. Change requests (Section 8 of the ALMA Users' Policies)

---

- Major change requests may be motivated by the following considerations
  - New information received since the original proposal submission
    - e.g. new observations including interim observational results of a project, other new information on planned observing targets, or externally-imposed changes to the scheduling of time-coordinated observations at other observatories
  - Technical considerations for implementation during Phase 2 (that are initiated by the PI, e.g. to optimize the scientific yield of the observations)
  - Mistakes made by the PI
- Please read **Section 8** and **Appendix B** of the ALMA Users' Policies carefully before requesting any changes!
